

FIG. 1

ENCODER DESCRIPTION

201	The encoder obtains a reference image frame.
202	The encoder encodes the image frame from step 201 and transmits it to the decoder.
203	The encoded image from the previous step is reconstructed by the encoder, in the same manner as the decoder will.
204	The encoder determines the structural information, i.e. segments, the reconstructed image from step 204. Alternatively, the encoder segments the original reference image frame from step 201.
205	The segments determined in step 204 are ordered by the encoder, in the same manner as the decoder will.
206	The encoder obtains a new image frame.
207	The motion related information of each segment is determined by motion matching.
208	The encoder encodes the motion information.
209	Based on the motion information from step 208, previously hidden regions, also known as the background residue, in the first frame may be exposed in the second frame.
210	The encoder orders the background residue locations, in the same manner as the decoder will.
211	The encoder attempts to fill each of the background residue locations (i.e., predict the background residues) from steps 209 and 210;
212	The encoder determines the difference between the predicted fill and the actual fill for each of the background residue areas.
213	The encoder determines the local residue areas in the second image frame, from the segment motion information.
214	The encoder orders the local residues from step 213, in the same manner as the decoder will.
215	The encoder encodes the background and local residues from steps 212 and 214.
216	<p>If the image can be reasonably reconstructed primarily from the motion information, with assistance from the background residue and the local segment residues, the encoder transmits the following information, and reconstructs the second frame, as the decoder will, and continues at step 206:</p> <ul style="list-style-type: none"> a. Flag denoting that the second frame is not a keyframe b. The motion related information for the segments c. Special instructions for segments d. The background residue information with flags denoting coding e. The local residue information along with flags denoting coding
217	If the image cannot be reconstructed in relation to the reference frame, the image is encoded as a key frame, a flag is transmitted to so inform the decoder, and the encoder continues at step 202.

FIG. 2

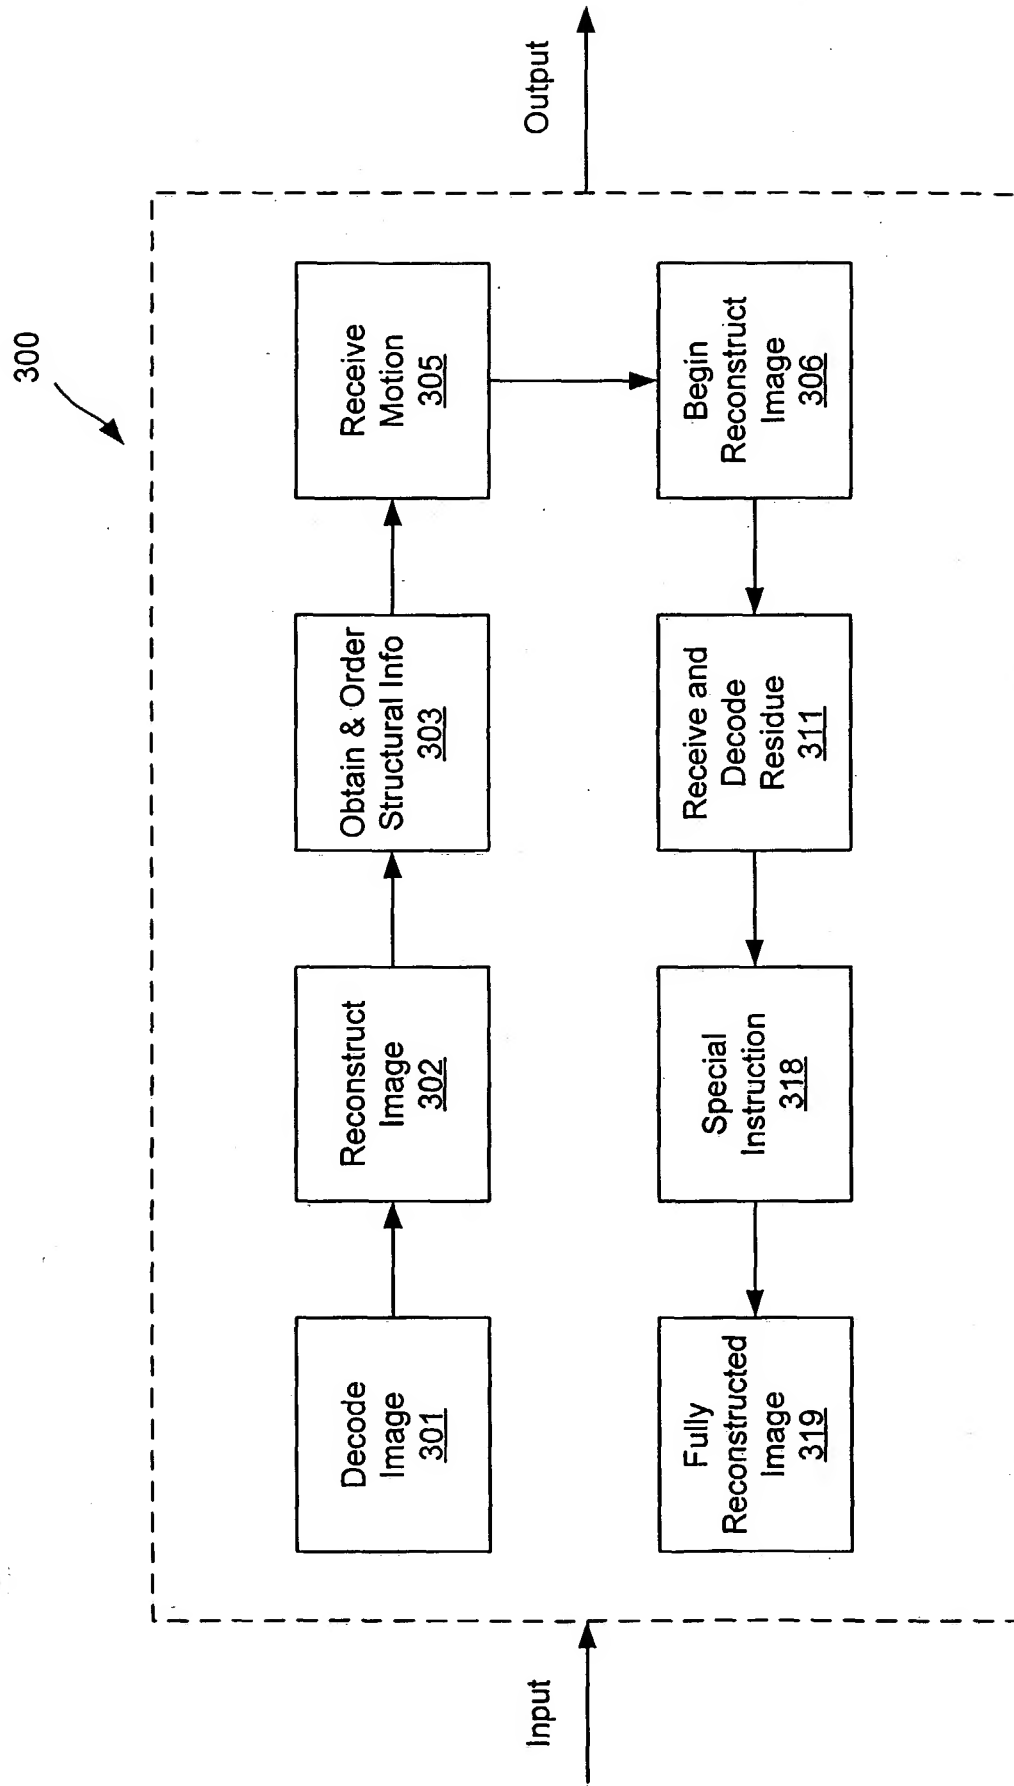

FIG. 3

DECODER DESCRIPTION

401	The decoder receives an encoded image frame.
402	The encoded image frame from step 401 is reconstructed by the decoder in the same manner as the encoder.
403	The reconstructed image frame from step 402 is segmented and ordered by the decoder in the same manner as the encoder.
404	The decoder receives a flag from the encoder stating whether the subsequent frame is a keyframe, i.e. not represented in relation to any other frame. If so, then the decoder returns to step 401.
405	The decoder receives motion related information regarding the segments determined in step 403 from the encoder.
406	The decoder begins to reconstruct a subsequent image frame using the segments obtained in step 403 and motion related information obtained in step 404.
407	Based on the motion related information from step 404 regarding the segments determined in step 403, the decoder determines where areas, previously hidden, are now revealed, also known as the background residue.
408	The background residue locations from step 406 are ordered in the same manner as by the encoder.
409	The decoder attempts to fill the background residue locations; thereby predicting the background residue information.
410	The decoder receives additional background residue information (i.e., relative to the predicted background residue) plus flags denoting the coding method for the additional background residue information from the encoder.
411	The decoder decodes the additional background residue information.
412	The computed background residue information and the additional background residue information is added to the second image frame.
413	Based on the motion information from step 404 regarding the segments determined in step 403, the decoder determines the location of the local segment residues, if any.
414	The local segment residue locations are ordered in the same manner as by the encoder.
415	The decoder receives coded local segment residue information plus flags denoting the coding method for each local segment residue location.
416	The decoder decodes the local segment residue information.
417	The decoded local segment residue information is added to the second frame.
418	The decoder receives any special instructions and adds them to the second frame.
419	Reconstruction of the second frame is complete.
420	If there are more frames, the routine continues at step 404.

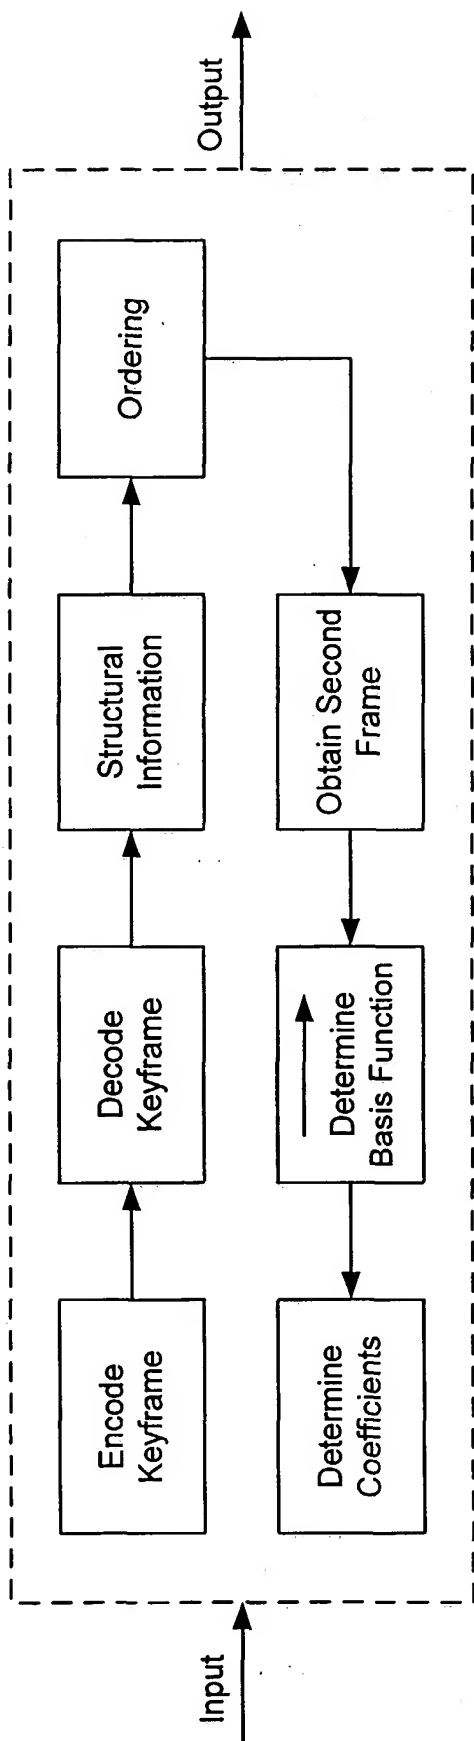

FIG. 5A

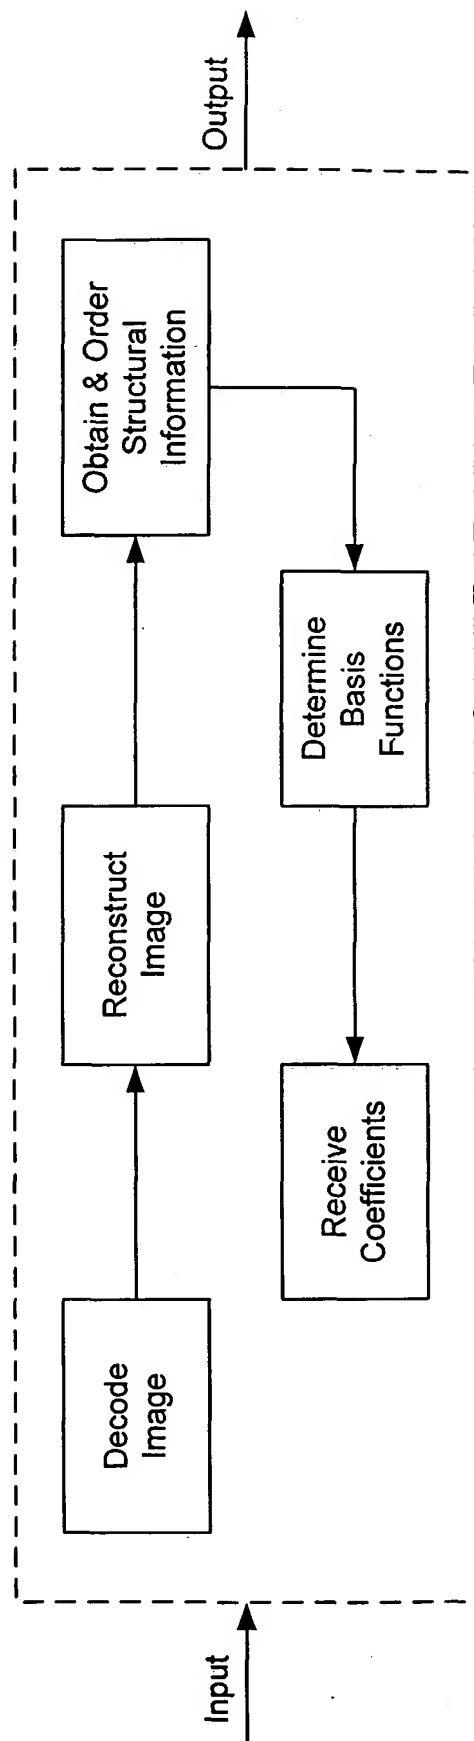

FIG. 5B

ENCODER/DECODER SYSTEM

	Encoder		Decoder
601	Obtain, encode, transmit reference frame →		Receive reference frame
602	Reconstruct reference frame		Reconstruct reference frame
603	Obtain Structural Information		Obtain identical Structural Information
604	Order segments		Order segments
605	Obtain 2nd image frame		
606	Determine motion relation information		
606a	Group by Multi-scaling and/or prediction from previous motion related information		
606b	Predict segment motion data		
607	Encode any motion related information relative to grouping and prediction		
608	Determine background residue		
609	Order background residues		
610	Predict background residue		
611	Determine sufficiency of prediction		
612	Determine local residue		
613	Order local residue locations		
614	Encode background and local residue		
615	Is 2nd frame keyframe? If yes, go to step 601 →		Receive keyframe flag
616	Transmit motion related information →		Receive motion related information
616a			Group segments by Multi-scaling and/or prediction from previous motion related information exactly as in step 606a.
616b			Predict segment motion data as in step 606b.
617			Determine and order background and local residue locations exactly as in steps 608, 609, 612, and 613
618			Predict background residue as in step 610.
619	Transmit background and local residue information →		Receive background and local residue information
620			Decode background and local residue information
621	Transmit special instructions →		Receive special instructions
622	Reconstruct 2nd Frame		Reconstruct 2nd Frame
623	Go to step 605		Go to step 605
